

WORKED EXAMPLE · SYSTEM MIGRATION

Migrating a service without losing control

A staged transition from a legacy runtime to a modular platform

The target has three responsibility layers

Boundary rule

The interface requests work. Control decides when it is safe. Providers implement stable contracts.

Evidence

Every decision records the gate and a recoverable state.

A gated sequence controls each migration

Sequence work by impact and reversibility

Decision rule

Start with reversible changes. For harder changes, require a tested rollback and an approved maintenance window.

Reading the matrix

This matrix guides sequencing. It does not estimate probability.

Progress depends on measurable checks

Exit condition

All supported workloads pass

Rollback remains available

Audit records are complete
